

```
1 function doSomething(a){  
2   a.height = "500"  
3 }  
4  
5  
6 let b = {height:"100", size:"100"}  
7 doSomething(b)  
8 console.log(b)
```

- ✓ A function of doSomething created with input **a**.
- ✓ Another input **b** is create outside of function and is declared with value **height:100** and **size:100**
- ✓ `a.height = 500` means replacing the height property from 100 to 500
- ✓ `*( .height` means selecting the height property in an object)
- ✓ `doSomething(b)` - calling the new input into the function.
- ✓ The code runs the doSomething function first so it replaces the height value and after that adds the new b input and prints out in the console.
